

To get it right, know what you have and what you need!

Technical Due Diligence

The technical due diligence (TDD) is an essential element when it comes to helping you to set up your project and constitute the needs to justify the investment(s). It is an investigation and verification process that identifies, validates and assesses the risks and weaknesses of the hardware and translates the technical elements into figures, from which a capital investment plan is then drawn up according to the project's stakes.

By making use of our multidiscipline team, we assure that you gain knowledge about the technical condition and design of the asset(s) under consideration through a thorough assessment of all existing construction documents and an identification of defects, poor performance and opportunities for improvement.

This way you avoid surprises since our approach provides insight into the costs and risks associated with the ownership of the considered asset(s).
